

Blog Posting Pipeline — Demo

Brief

This documents the *demo* at `blog-posting-pipeline-demo/` — a fabricated, scripted replay of a 7-step architecture — not the real, private `blog-posting-pipeline` production system it describes.

1 What it is

A static, three-panel HTML/CSS/JavaScript page (no server, no build step) that steps through the real, private pipeline’s actual 7-stage architecture — Brief, Keywords, Section plan, Writer, Image prompt, Image, Publish — against a chosen fabricated example run for an invented brand, “Nordkast Coffee Supply.” A second tab, Blog Library, mirrors a real client’s actual, live blog completely: 15 real posts from `davonex.com/blog`, stored locally. The real system researches, writes, illustrates, and publishes real posts for real Digitalise Agency clients; its source stays private since it is the agency’s live product methodology. No step here is actually executed and no network call is ever made.

2 Architecture

`demo-data.js` holds `DEMO_RUNS` (three complete fabricated runs, each with all 7 steps, labeled with the real system’s actual per-step model names), `PRESETS` (the three selectable example chips, two explicitly modeled after named real `davonex.com` posts), and `REAL_DAVONEX_POSTS` (the same 15 real, frozen posts as the sibling demo). `app.js` drives preset selection, the timed step-through reveal, the Publish step’s full article-template preview, the reader, and the library countdown.

3 The seven steps

Clicking “Run the pipeline” reveals these seven step cards one at a time, 900ms apart, auto-scrolling. The Writer step (step 4) produces a full article with intro, headed sections, an FAQ, and a numbered

References list, matching the real system’s actual prompt structure. The Image step (step 6) shows a real, freely-licensed stock photo captioned “not AI-generated,” standing in for the real system’s actual Gemini image output. The Publish step (step 7) renders a full recreation of **davonex.com**’s real live article template — nav, breadcrumb, prose, references, author line, final CTA band — under an invented “Nordkast Coffee Supply” brand, plus a cost table.

4 What’s real vs. illustrative in the numbers

The one headline total cost per run (\$0.35–\$0.42) is the real production system’s actual published cost range from its own README. The per-step cost line items shown underneath are illustrative, built for this demo, and explicitly labeled as not the real exact breakdown.

5 The honesty pattern

A permanent, non-dismissable banner discloses fabrication throughout; the one fabricated Blog Library card carries its own second disclosure ribbon; and the three fabricated-run photos are real stock photos with separate open licenses (CC BY, CC BY-SA, public domain), documented in `assets/images/CREDITS.md`, never AI-generated and never claimed to be.

6 Setup and license

No setup: open `index.html` or serve the folder statically. `netlify.toml` publishes the repo root with no build command. Licensed under PolyForm Strict License 1.0.0 (this repo’s original code and fabricated content only — the stock photos and the real client content carry their own separate, documented provenance).

7 Glossary

Pipeline

An ordered sequence of processing stages where each stage’s output feeds the next stage’s input.

JSON

A structured text format for data (objects, arrays, strings, numbers) used here to display each early step’s fabricated input/output.

LLM / model name

The AI model each real step actually uses; labels here are descriptive only, no model is ever called.

IndexNow

A protocol for notifying search engines the moment a page is published or updated, rather than waiting to be crawled.
